

I support the ARSFI position. One of the benefits Amateur Radio provides to the nation is in the development of new modes and methods for communications. Technology, by its very nature must advance. Spark gap transmissions could be deciphered with very basic receivers. When the art and science of radio advanced to continuous wave for Morse Code, the old receivers were no longer adequate and had to be replaced. The same was true with the advent of voice, sideband, radio teletype, etc.. This is the natural progression of technology. ARSFI has presented a reasonable argument, which I support. Thank you.
